

XC1000D SERIES: CONTROLLERS FOR APPLICATIONS UP TO 15 COMPRESSOR/FAN OUTPUTS – SERIAL OUTPUT

- XC1000D series for compressors and condensing fans monitoring and management of medium-large compressor racks
- VISOGRAPH programmable graphic display (LCD 240x96 pixel)
- Scroll, semi-hermetic, multi stages, with different power and screw compressor management
- Proportional band or dead band control
- Temperature and pressure display depending on the gas (Freon, NH₂, CO₂ ...)
- Concise information about the variables of the compressor rack through the VISOGRAPH display
- Great versatility and extensive customization opportunities
- 2 analogue outputs for frequency compressors

- 2 analogue outputs for inverter for fans
- Reduced set point for energy saving management
- Hourly run time signals for maintenance
- Dynamic set point for energy saving
- Sub-cooling management
- Last 100 alarm conditions storage and display
- Special algorithms for energy saving
- Standard communication protocol ModBUS-RTU
- Hot key or Prog tool kit connector for a quick and easy programming
- 12VA max power absorption
- Type of refrigeratant gas: R22, R134A, R404A, R507, R717
- Resolution 1/100bar, 1/10°C, 1°F, 1PSI

HOW TO ORDER

XC1000D X C 1 0 D - 1 B 0 D E

В	D	E
Measurement unit	4÷20mA	Input
C = °C	0 = No	C = NTC
$\mathbf{F} = {}^{\circ}F$	1 = Yes	$\mathbf{D} = PTC$
$\mathbf{B} = Bar$		$\mathbf{E} = 4 \div 20 \text{mA}$
$\mathbf{P} = PSI$		F = Suction PP11; Delivery PP30
K = Kpa		G = Ratiometric

KINDS OF CIRCUIT

The XC1000D series is able to manage in the best possible way the majority of applications for refrigeration circuits.

CO₂ REGULATION

 CO_2 use is increasing thanks to the advantages it offers in cooling plants. For this reason there is also a greater demand for accessories. Thanks to special algorithms and an appropriate pressure range, the XC1000D series can manage and monitor CO_2 plants that work in cascade connection with sub-critical cycle.

STANDARD REGULATION

NEUTRAL ZONE ADJUSTMENT

A pressure value (set-point) and a band that is symmetric compared with the set value can be programmed. Within this band a state of system equilibrium can exist, where the instrument will maintain the status of the outputs. If the pressure moves outside this band the switching on and off of available outputs begins, subject to delays set in the parameters "delay between two consecutive starts" and "delay between two consecutive stops", always respecting the protection times of each compressor. The graph illustrates, in a simplified way, neutral zone regulation with equal loads.

PROPORTIONAL BAND ADJUSTMENT

A pressure value is set (set point) and an adjustment band is positioned over the set point. The adjustment band is then divided into equal parts, one for each stage being controlled. As the pressure increases and passes the various stages, the controller activates each load. As the pressure decreases, the loads are turned off. In this way, above the adjustment band all the compressors will be running, while below the band they will all be off. The switching on and off of the loads is carried out in such a way as to balance the running hours. The graph shows, in a simplified way, the adjustment algorithm with 4 equal loads.

ENERGY SAVING MANAGEMENT

The new XC1000D series gives to the user several solutions that let you to manage energy savings, so important when we deal with "compressor management". The controllers have a special algorithm that lets you to optimize the efficiency of the plant, ensuing energy savings. The following are a range of the most important solutions that Dixell offers to customers to achieve energy savings.

COMPRESSORS WITH INVERTER

When the plant needs more power (when the temperature gets out of the band) the inverter compressor (C1) frequency increases. If this is not enough, the other compressors (C2, C3, ...) will be activated in sequence. At the same time the controller will modulate the inverter compressor frequency in order to have a uniform increase of the plant power.

FANS WITH INVERTER

When the plant needs more power (when the temperature gets out of the band) the inverter fan (F1) frequency increases. If it is not enough, the other fans (F2, F3, ...) will be activated in sequence. At the same time the controller will modulate the inverter fan frequency in order to have a uniform increase of the plant power.

SUCTION DYNAMIC SET POINT

Suction temperature/pressure optimization can depending on retail space temperature.

The dynamic set point guarantees excellent plant efficiency, considering the real operational conditions. The plant modifi es the suction temperature/pressure according to the retail space temperature so the refrigeration power changes depending on the real thermodynamic exchange.

SET TEMP

External Temperature

CONDENSER DYNAMIC SET POINT

Condenser temperature/pressure optimization can depend on the external temperature.

The condenser temperature/pressure is modified according to the external temperature. The condensing set point is automatically adjusted according to the external temperature, to get an optimum condensing temperature.

Condenser set point

SET

SET MIN

SET MIN TEMP

REDUCED SET POINT

An internal 7 day clock can automatically change the adjustment's set point, depending on a particular system's individual requirements, to enter an energy saving cycle during nights and weekends, when less power is required. This energy saving cycle can also be initiated from an external source via a digital input.

SUPERVISION SET

The connection to the modern supervising systems (of Dixell) allows, thanks to the CRO special algorithm (Compressor Rack Optimization), to manage in the best way the compressor rack set point depending on the devices connected, with the result of having an optimize energy saving on the plant. The system, equipped with the CRO function, analyzes the information from the controller in the application to determine if a controller needs more refrigeration power and the quantity. The set point will be re-calculate in order to satisfy the worse instance and sent from the supervising system to the XC1000D; this will be the working set point (fig. 1). If the supervising system can't manage the XC1000D, is the controller that "decided" to replace the set point (coming from the system) and will then define the set point in the program phase.

The 2 graphs (fig. 2) emphasize that when the CRO algorithm is active, in a real installation, the set point becomes on average higher, and consequently the energy consumption decreases. The dotted line represents the average weekly value.

XC1000D

ADVANCED CONTROLLERS for the SIMULTANEOUS MANAGEMENT of UP to 8 COMPRESSORS and FANS

XC1008D

Advanced digital controller for compressor racks with up to 8 compressors and fans simultaneous management

D: 10 DIN Rail

FEATURES	XC1008D
Power supply	24\/ac/dc (from TE10D)
Probe inputs	
Suction 1	NTC/PTC/4-20mA/0-5V
Suction 2	
Condensing 1	NTC/PTC/420mA/05V
Condensing 2	
Auxiliary 1	NTC/PTC
Auxiliary 2	NTC/PTC
Auxiliary 3	
Auxiliary 4	
Digital inputs	
Low pressure switch 1 (main voltage)	pres
Low pressure switch 2 (main voltage)	
High pressure switch 3 (main voltage)	pres
High pressure switch 4 (main voltage)	
Safety loads (main voltage)	8
Free of voltage	4 config
Relay outputs	
Loads	8 x 7A config
Alarms	2 x 8A
Other	
Hot Key/Prog Tool Kit output	pres
Remote display output	VGC810
Serial output	RS485
Inverter compressor output	4÷20mA/0÷10V opt
Inverter fan output	4÷20mA/0÷10V opt
Buzzer	on keyboard opt
External module connections	LAN opt
